

# **Ceramic solar container capacitor issues**

## Overview

---

This article breaks down common multilayer ceramic capacitor failure modes including low insulation resistance (IR), low capacitance, mount failure, and appearance defects. It also explores what often causes these issues, whether from manufacturing processes or how the capacitors. By carefully considering these factors during design, selection, and operation, it is possible to significantly. Vibration, board flex, or temperature swings can cause cracks in the ceramic body. What are the possible ways in which such a capacitor might fail?

One cause of unreliability is failing to design boards to minimise the considerable thermal stresses to which MLCs are subjected during soldering.
