

Dyson sphere project achieves solar container

Overview

This hypothetical structure, proposed by the British-American theoretical physicist Freeman Dyson in 1960, offers an extraordinary vision: a vast network of solar-collecting satellites orbiting a star, capable of harnessing nearly all the energy produced by that star . A Dyson sphere is a hypothetical megastructure that encompasses a star and captures a large percentage of its power output. The concept, also depicted in a Star Trek episode, would fill Earth's orbit with satellites to harness energy from the Sun and block out solar rays to help cool the climate. Elon Musk has once again turned his attention skyward — this time with an audacious idea that blurs the line between space engineering and.
