

Effects of the solar container station explosion on the field

Overview

Lithium-ion batteries have been known to cause fires, explosions, arc flashes, electric shocks from the energy storage systems can expose workers and area residents to toxic chemicals. oximately 16:55 hours and discharged a total flooding clean agent suppressant (Novec 1230). The injured firefighters were members of a hazardous materials (HAZMAT) team that arrived on the scene at approximately 18:28 hours. (GPL), the incident occurred when a crane lifting a container came into contact with live overhead wires, causing significant damage to one of the company's key transmission lines. A fire erupted on Monday inside a solar battery storage container at the Valley Center Energy Storage Facility in northern San Diego County, California. The large fire spread of the energy storage power station indicates that the on-site firefighting system failed to control the fire in the first time, and the hand-held fire extinguishing device installed on the site cannot functionate, What caused the explosion at the power station?

The sudden.
