

Electrostatic solar container materials

Overview

ESD safe containers are permanently static dissipative in the most desired range of 10^6 to 10^9 ohms/sq using only one to two percent carbon black. Electrostatic dissipative (ESD) materials are designed to prevent the build up of static electricity, thereby protecting sensitive electronics and reducing risk in highly controlled industrial settings. Compared with antistatic plastics, which typically have a controlled surface resistance between. Discharges from external sources like humans and equipment or induced electrostatic fields can damage ESD sensitive parts.
