

# Safety risks of large hot water storage tanks

## Overview

---

These hazards can be a result of the presence of hazardous gases, vapors, fumes, cleaning chemicals, dusts, improper or insufficient lockout-tagout, or excessive heat or cold. Additionally, the creation of an oxygen-deficient or oxygen-rich atmosphere may cause serious injury. Hazards encountered in petroleum and petrochemical storage tanks include, fire or explosion, asphyxiation, toxicity, entrapment, falls, and physical and chemical hazards including steam, heat, noise, cold and electrical shock. It is important that facilities, State Emergency Response Commissions (SERCs), Local Emergency Planning Committees (LEPCs), emergency responders, and others review this information and consider whether additional action is needed to. When they took samples from drinking water storage tanks, they found that drinking water was micro ial contaminated at every sampling location. ASME sets the rules for the design, fabrication, and inspection of pressure vessels, which includes.
