

Sodium battery solar container density

Overview

Lower Energy Density: Sodium-ion batteries currently have a lower energy density compared to lithium-ion batteries, meaning they are heavier and larger for the same capacity. This could limit their use in applications where space and weight are critical factors. In some applications, sodium-ion cells are now cheaper to manufacture than LFP batteries, making them especially attractive for stationary energy storage, grid balancing, and hybrid solar systems that require long cycle life and stable performance rather than maximum energy density. The electrodes are separated by a solid ceramic, sodium beta alumina, which also serves as the electrolyte. The battery temperature is kept between 300° C and 360° C to keep the electrodes in a. CATL and BYD, two major players in the battery industry, have introduced groundbreaking sodium-ion batteries.
