

The solar container tank has nitrogen

Overview

It receives nitrogen from the nitrogen generator and stores it at a certain pressure. The gas is stored within the tank and, when needed, is gradually released, maintaining stable airflow within the system. A flat-topped, nitrogen-blanketed atmospheric-pressure tank in a plant at Texas City, Texas, has a diameter of 30 ft and a height of 20 ft (9). Skin can survive brief contact with -80°C surfaces, but bare skin coming into contact with liquid nitrogen (or objects cooled by it or gases evolving from it) will be severely damaged, comparable to burns caused by contact with boiling water. Liquid nitrogen is the most commonly used element in cryogenics which used for specialty chilling and freezing applications.
