

What is the work of the solar container station in the thermal power plant

Overview

Fluid from the low-temperature tank flows through the solar collector or receiver, where solar energy heats it to a high temperature, and it then flows to the high-temperature tank for storage. All solar thermal power systems have solar energy collectors with two main components: reflectors (mirrors) that capture and focus sunlight onto a receiver. This heat is then transferred to water, which becomes superheated steam, which is then used to produce electricity.
