

# **Wind mobile stores energy through transmission**

## Overview

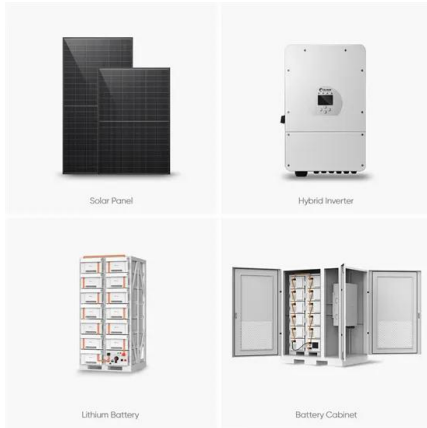

---

Mobile wind stations are essentially compact, transportable wind turbines designed to generate power wherever it's needed. The animation explains how wind can be used at all of these interconnected locations. The electricity generated by wind turbines is sent to a transmission substation, where it is transformed into extremely high voltage (between 155, 000 and 765, 000 volts). The hourly electric power demand is relatively periodic on a 24 hour cycle, with peak demand occurring in the daylight hours. In today's pursuit of sustainable energy, the mobile wind power station is emerging as an innovative energy supply method, offering a reliable power source for a variety of scenarios through its unique portability and flexibility. Wind turbines themselves do not directly store energy in the same way a battery does; instead, the energy they generate is converted and integrated into the power grid, or used to power other storage systems.
