

Working principle of solar container cabinet heat pump system

Overview

This article aims to explore the working principles of these systems, highlighting the process of solar energy capture and transfer in solar heating, as well as the extraction and transfer of heat energy from the natural environment in heat pump heating. Heating pumps move heat from one location to another, and it takes (in some cases) something like one quarter of the energy required to “make” heat. This efficiency makes them significantly more efficient than traditional water heaters, such as gas boilers or electric immersion heaters. For direct solar heat pumps, the solar thermal collectors preheat a fluid that the heat pump.
